" " Tools Visual Logger Visual Logger 2003 AxTools AxTools Visual Logger 2003 Let the development process become more easy! Look how to get started with the AxTools Visual Logger!

- Configure logging settings from the Visual Logger window, or using the configuration file that is generated in the application directory
- Setup log groups and filter them
- Set log levels
- Choose where and how to save the log file
- Upload the log file
- Query the log file and analyze it
- Attach a callback procedure to the log events and receive notification when a change is made
- Use the Visual Logger attached to another application, use the configuration file or manually configure the ActiveX server from within your own code
- Use the properties of a log event to get the log data
- Send a log file to a different machine
- The Visual Logger can be deployed with your application, either as a separate application or in the code. In this case, the application will automatically retrieve the log data from a log file or from the attached Visual Logger server.
- The Visual Logger can be run as an out-of-process server (without any additional libraries or tools). This approach has proven to be more stable, and is also faster.
- Receive notification about a change to any of the log levels, including the user notification, so that the developer can react and continue the process
- Disable logging temporarily and manually perform setup of the log data
- Global log filtering and scheduling, so the logs are only displayed during development phases. Disable logging when your code is finished
- Modify the log at runtime and keep the changes
- Save the log to a proprietary log file format or to a text file
- Set the log color and indenting
- Set the log window to foreground or minimized to the system tray, depending on the preferred development environment.
- Export the log to a text file or to a proprietary file format
