We are in the process of learning IdentityServer4 for IdentityServer4 framework. We wonder: When we have created our own claims(example we had 2 claims [LoginType, InstalledPackage]) will the same claims response be returned to the Api or will it be a different claims response? And we are assuming that the backend api will be in (Powershell) A: With IdentityServer 4 there is a single instance of IdentityServer that is instantiated on both the UI and the API server. There is a single instance of HttpContext available to both the UI and API. In the API you would use that HttpContext instance to retrieve the user from the authentication header. Then you can process that user (with extra claims) using the special claims provider. The performance of the API is dependent on how well you architect your API. Generally, the more complex your API is the more challenging it will be to write well performing code. d4474df7b8
