package problem1205 import "testing" type testType struct { *Node T int l [][]int } func TestSort(t *testing.T) { ast := &testType{ Node: newNode(0, -1), T: 2, l: [][]int{ []int{2, 3}, []int{5, 1}, []int{4}, }, } result := sort(ast, func(a, b *Node) bool { return a.Val() < b.Val() }) Role of potassium channels in myocardial performance after ischemia and reperfusion. The effect of potassium channel blockade on myocardial performance was studied in an experimental canine model of ischemia and reperfusion. Myocardial performance was studied by comparison of left ventricular function assessed by an end-systolic balloon-tip catheter and pressure-conductance catheter. The data show that the potassium channel opener, levromakalim, as well as the KATP channel opener, pinacidil, increased myocardial performance during ischemia, both in the presence and absence of beta-blockade with propranolol. These data suggest that these potassium channels have an important role in both improving myocardial performance and maintaining viability after ischemia, and that they mediate the beneficial effect of potassium channel openers in this setting. How to survive the graduate job market, MBA or no MBA - akieru ===== SwellJoe While I can't argue with the general
