
Create PDF files from PowerPoint presentations. KEYMACRO Features: 1. Automatically starts when PowerPoint starts. 2. Automatically closes when PowerPoint closes. 3. Safe mode is in sleep mode (not responsive). 4. When save as PDF option is activated, a confirmation dialog box is shown. 5. Undo/Redo function. 6. When you save a file, the title of the file is automatically changed. 7. Can select a title and insert it to the output PDF file. 8. Allows you to remove the file extension. 9. Options for output to: Microsoft Office, EML, EMLX (Office format) and Text (a plain PDF file). 10. Protecting file, including file renaming and system security. 11. Password protection is based on PDF format. 12. Set compression ratio for output PDF file. 13. A small application icon is shown on task bar. 14. When we work with several documents, only one title and one navigation bar are shown for all files. 15. Fill in information from Microsoft Office form fields. 16. Displays the converted file's details. Harvey Weinstein has been reportedly indicted on new charges in New York City — this time for allegedly raping an aspiring actress and a production assistant at his Tribeca penthouse apartment. The indictment was made public Thursday, according to The New York Post, which said 45cee15e9a

There are thousands of amazing images and icons out there that are easily accessible online, the purpose of the KEYMACRO package is to make it easier for you to use these resources. After more than a year of work on the project, today we are pleased to announce the release of Brackets 1.4, the newest version of the popular open source code editor for OS X. This release is notable for being the first update to our source editor we've produced from an alpha or beta release. This is our first milestone release, and we're eager to learn what you think of it. These first alpha and beta releases of Brackets 1.4 helped us build a foundation for the major upcoming features and APIs for the editor. We've been focusing on stability, documentation, extensions, and performance in this release, so the rest of this post will highlight some of the more exciting new features. A Debugger in the Source Editor With Brackets 1.4, our source editor supports a new debugging API that gives developers the ability to access the state of an extension or HTML node and modify it through a visual editor. For example, to set a HTML node's style property to red, you can select a HTML node, click the button for the property name (e.g. "style"), and click the "Set style" button to set the style property's value to "color: red". The selected node will be highlighted in the visual editor. You can also see the result of the change in the diff pane. Other properties, such

as selected or checked, are supported as well. Developers can interact with the source editor in the same way they would with the web inspector. For example, the visual editor has an “Enable developer tools” button that opens the inspector for selected HTML nodes. There is a complex API to build debuggers in the source editor, and we plan to build out a set of developer tools to support extensions and plugins in the future. We are in the process of releasing an early prototype of this debugger today. This prototype is based on the WebKit Remote Debugging Protocol. To debug a web page, you’ll first need to enable remote debugging in the developer tools (you can find this under the “Preferences” tab). This will give you a link to the remote server that you
