A: In your html file, you can use a base href like so: This will use the domain specified in the href to determine what website to serve the file from. In this case, you have a HTTPS reference, so that's used. If you wanted to change it to use the current domain, you could use a wildcard. And it would attempt to look at www.yourdomain.com, then then and so on until it found a match. Exciting news! The first people of our generation who will discover the web is heading to the ISS in 2017. Once there, they'll use it to watch a few interesting videos and perhaps snap a few photos. These astronauts will also be the first to have access to a real food replacement bar, and, for science! they will eat whatever was left over from the last time they were in orbit. Thanks to a new partnership between NASA and a Danish company, we'll also get a glimpse into their trip to space. An astronaut returning from the ISS on Earth will download a new app, all thanks to a partnership between Denmark's Systematic, a Danish internet service provider, and NASA's Jet Propulsion Laboratory. After six months of beta testing, the Astronaut Delivery and Control System (ADCS) will be up and running. It will be an app similar to Google Maps or Apple Maps. It will let astronauts navigate back home. They will also be able to access their email, check the news, and send messages back to Earth. The app will use satellite navigation to pinpoint the ISS's location. After astronauts' real location has been calculated, the app will inform them of their location and direction. Users will be able to choose how long they want the ISS's location to be displayed. After the ISS astronauts return from space, they will download a new app, ADCS 2.0. This 2d92ce491b
