The present invention is concerned with a recording process in which information is recorded in an information medium such as a magnetic recording medium. The present invention is also concerned with a recording apparatus for performing the recording process. Using the present invention, a data signal can be recorded in a magnetic recording medium such as a thin-film magnetic medium. More specifically, the recording process can be performed by recording data on the magnetic recording medium while a read head is moved in the width direction of the magnetic recording medium. In the present invention, the recording of data signal in the magnetic recording medium can be achieved by magnetizing a region on the recording medium to which the read head is moved. More specifically, by magnetizing the region on the recording medium to which the read head is moved, the direction of magnetization of a region of the magnetic recording medium to which the read head is moved can be controlled. The data signal can be represented by, for example, at least one of various data formats. In the present invention, a data signal to be recorded is read by the read head, the magnetic recording medium is magnetized by the read head to record the data signal in a region to which the read head is moved, and then the data signal is reproduced by the read head. For example, the data signal may be reproduced by detecting a signal corresponding to the data signal as magnetic field variations. The present invention is able to read and reproduce data of various formats by changing the read position of the read head in the width direction of the magnetic recording medium. The present invention is able to read and reproduce a data signal of a wide range of formats by

changing the read position of the read head in the width direction of the magnetic recording medium. Q: Plotting function value vs.  $x$  I'm trying to plot something that looks like  $f(x) = \frac{2e^{2x}}{1+e^{2x}}$   $f(x)$  is a function of  $x$  but I don't really know how to plot it. I understand that I can't plot this because the domain of  $f(x)$  is  $x \in \mathbb{R}$  while the domain of the plot  $y=f(x)$  is  $x \in \mathbb{R}^+$ , but the domain of the plot is  $x \in \mathbb{R}$  and if I plot  $f(x)$

Q: Custom polyline renderer making a very small polyline I am trying to make a custom polyline renderer for a sample app. I took the example from the Google Maps Documentation. class CustomPolylineRenderer : PolylineRenderer { override class func isMarkerRequired(\_ marker: GMSMarker) -> Bool { return marker.visible? false : true } override func prepare(for marker: GMSMarker, at point: GMSCoordinate) { //We add a blue stroke that won't be visible marker.setStrokeColor(UIColor.blue, strokeColor: 1.0) marker.setStrokeWidth(1.0) //We want to use the same path as we show on the map let path = marker.presentation()!.path marker.presentation()?.path = path marker.presentation()?.isClosed = true } } //CustomPolylineRenderer above is applied to the GMSMapView.renderer property. Everything works fine except that the line is very small (almost invisible). I am using the same map settings and markers as in the example. Any ideas? A: The Google example code uses a custom annotation to change the stroke width. I suspect that you are seeing the same behavior since the Google code has an annotation that uses CustomPolylineRenderer as its renderer. Q: How do I get both a grid and a table view in a cell? How do I get both a grid and a table view in a cell? I have a UITableViewController subclass, and I have a custom cell that uses a UIT 2d92ce491b
