The Game StopThe present invention relates to a fluidic device, in particular for an agricultural sprayer, comprising a flexible tubular body with at least one first outlet port and at least one second outlet port and a valve assembly. Fluidic devices are known in the art. They can comprise fluidic pumps and injectors for the introduction of metered quantities of fluid. In the specific case of agricultural sprayers, fluidic devices are generally comprised of a flexible tubular body with a first and a second outlet port. A first inlet port and a second inlet port are generally connected to a metering pump. Metered quantities of fluid are injected at high pressure through the first and second outlet ports to a spray nozzle and a chamber. In the case of agricultural sprayers, in which the spray nozzle is comprised of a rotatable and removable cap which opens or closes the outlet ports, the first and second inlet ports are generally provided on the sprayer cap. The fluidic device comprises a valve assembly which is usually comprised of a spring-loaded actuator (valve member) between two rigid valves. The rigid valves, which are shaped to

the outlet ports, cooperate with the actuator. The fluid flow is switched from the first inlet port to the second inlet port when the actuator is released by means of the valve member. This way the fluid will flow in the tubular body from the first outlet port towards the second outlet port until a stop which is situated opposite the first inlet port prevents the flow of fluid. The stop which is situated opposite the first inlet port can be achieved by providing an annular groove, which is shaped to the first inlet port and which stops the fluid in the tubular body, in the periphery of the outlet port. When the actuator is released, the spring-loaded valve member acts on the valve. Thus, the actuator switches the valve. The flow of fluid is only permitted to reach the second inlet port when the actuator is released by the valve member. A third inlet port and a fourth inlet port can also be present in the flexible tubular body. The third and fourth inlet ports allow a metered quantity of fluid to be injected from the metering pump. The metering pump can be set up to inject a metered quantity of fluid at regular intervals. A metering pump, for example a gear pump, can inject a metered quantity of fluid through the third and fourth inlet ports. The f3e1b3768c
