Download. Perception of heavy and light objects by white-faced capuchin monkeys (*Cebus apella*) in comparison to chimpanzees (*Pan troglodytes*). Since the ability to perceive the weight of objects was suggested to be fundamental to the evolution of hominins, weight perception in primates has been intensely investigated. Most

---

of this research has focused on weight discrimination and the use of non-human primates (especially macaques) to assess functional, evolutionary aspects of this ability. In the current study, the weight perception abilities of wild capuchin monkeys (*Cebus apella*) were compared to those of chimpanzees (*Pan troglodytes*) in a

---

set of simple reaching tasks that did not require them to differentiate between weights. The capuchin monkeys were able to reach for and grasp heavier, as well as lighter, objects. They performed better when the grasping component was required than when it was not. For all subjects tested, the shortest latency

---

to grasp a heavy object was shorter than that needed for a light object. Capuchin monkeys frequently used their hands to investigate the weight of objects before grasping, while chimpanzee
