What's New in the?

I know it's been a while since my last version, but with all the nasty issues with pre-updates of XP's SP3 and Windows 7 RC's bugs I decided to take a break. V1.1 / 15.04.2008 - added facility to scan incorrect checksum values for numbers that will remain invalid (eg. too long, too small) - now operating windows 95 through win2k8 - now checking for version 7 and 8 also - you can manually enter values to be used with the newer system - you can now enter custom strings, as well as numbers - custom string validations are performed before checking the number - added [x] to "Go to next item" and [] to "Go to previous item" button - fixed for compatibility with IE8The present invention relates to a steel pipe coupling adapted to be internally connected to a steel pipe or the like and, more particularly, to a steel pipe coupling which has a high connecting strength while being excellent in corrosion resistance. There is known a steel pipe coupling comprising a bowl arranged to be externally connected to a first steel pipe, a stem arranged to be internally connected to a second steel pipe, and a nut arranged to be screwed onto the stem. The steel pipe coupling is assembled by inserting the stem into the bowl, thereafter connecting the stem to the second steel pipe through means of an adhesive, and thereafter connecting the bowl to the first steel pipe. However, the conventional steel pipe coupling has been defective in that when the nut and the stem are screwed together, the stem becomes loose due to the tensile stress caused by tightening of the nut, resulting in a decrease in the connecting strength. Moreover, when the stem is tightened, not only the tightening of the nut is required but a force is also required to penetrate the threaded portion of the stem, which gives rise to a problem in that a large force is needed for assembling work. In view of this, it has been attempted to establish a steel pipe coupling as disclosed, for example, in Japanese Patent Application No. 59-65604 (1985), which requires a force to be applied only to the nut to thereby maintain the stem in the connected state. However, the steel pipe coupling disclosed in Japanese Patent Application No. 59-65604 (1985) has been found disadvantageous in that the tensile stress caused by tightening of the nut is concentrated at the distal end of the nut owing to the configuration of the metallic portion of the stem, so that
