Nandub Serial Key, a software designed for processing video and audio streams, has been released to coincide with the DivX 3.11 release. It is now possible to capture and edit video and audio streams using the new DivX 3.11 (compatibility with DivX 4 is under development) codecs. Nandub is a software that works with AVI files and relies on DivX 3.11, the MPEG4v2 codec, a plug-in for VirtualDub and the 'WavPack' codec to handle AVI input video. The program is able to perform video compression, noise reduction, re-encoding, lossless compression, interleave processing, and it also has basic image conversion capabilities.

Nandub can operate as a standalone application or as a plug-in to VirtualDub. When using the plug-in, you can record video from the program's input channels, and it can be used to capture or generate image sequences, extract audio streams or to compress audio streams. Nandub operates in three modes, capture, editing and streaming. The capture mode uses a real-time playback to record video while the editing mode enables you to start the encoding process and to preview the video streams in a window. The streaming mode allows you to record and playback video and audio streams and to generate image sequences. When capturing video, you can select from among five video frame rates (including the default one) in order to adapt the video duration to the encoder's output format. The capture process is also possible with audio streams. When capturing audio, you can choose between sample rates from 44.1 kHz to 192 kHz and bitrates from 1-15 Mbps, so you can adapt the bitrate to the audio encoder's output format. You can also perform video compression and noise reduction in capture mode and it is also possible to re-encode the captured video and audio streams, by using the DivX 3.11 and MPEG4v2 codecs. Capturing and editing video is made possible using an external encoder and a virtual DV monitor that allows you to preview all the input video, audio and image streams. Capturing is also possible from the streaming mode, but the preview window is not supported. The preview process is carried out through the DivX 3.11 video player. In addition, when capturing, you can choose among five color depths. The program supports bitmap and RGB-color
