With the economy in the gutter, I'm looking for something that'll hold my cash. While I may have been able to bring myself to the check-out counter and make an unreasonable request, I thought I'd share some pics of the ones I've been seeing everywhere. If you've got a spare moment, take a look at them. This works great for all controllers with the exception of the NA version of the Gamecube controllers, which could only be rewired to allow the fan to work. For the wii-ud, I don't know if the fans are the same fan that can be used with the wii-udA and B controllers that support the wii-ud. Those only have 2 fans. What's New In?

Keyboard bindings are two items of information that the system and the player use to determine the game input to use. The Controller Information, such as the assigned controller number, and the Controller Acceleration, such as the controller wheel delta. Keyboard bindings are an A.I. program that creates a mapping between a game input, such as a controller button press, and a keyboard command, such as a keyboard button press. At the most basic level, a keyboard binding is a byte-to-byte mapping of game input to the keyboard input. Inputs that are mapped to keyboard inputs are usually mapped to keys that are close to the player. When the player is on the keyboard, the player inputs are less likely to be treated as non-inputs (left bumper or right bumper buttons on the D-pad) and instead are likely to be mouse inputs, which are more likely to be considered as input events. However, there are also keyboard commands (such as HID_Y) that are not normally treated as input events, and can be problematic to bind to certain keyboard commands. Player controllers are designed to easily be remapped from player to player, and so, keyboard bindings are generally remapped between players. The default order of inputs for controllers is backwards in the game. Ctrl P1 (default, P1) → Ctrl P2 (on a gamepad) → Ctrl P3 (alternate keybind) → Ctrl P1 (P1) Ctrl P2 → Ctrl P3 (on a gamepad) → Ctrl P1 (alternate keybind) → Ctrl P2 (P2) Ctrl P3 → Ctrl P1 (on a gamepad) → Ctrl P2 (alternate keybind) → Ctrl P3 (P3) When a game uses HID key bindings, the key binding will specify a HID_XXX command to use, in addition to whatever keys the keyboard command map (key-to-command) specifies. Some keyboard commands can modify the input state of the game. Examples of keyboard commands include editing the rotation state of the gamepad, or changing the player's invisibility state. The following shows an example of where the player might normally input a Left bumper press, and where they might normally input a Left bumper press on controller input. PlayStation 4 Controller Config File Example: [general] ... [input] ... [USB] --- [assigned] --- [controller] ...
