

Taglib Property Handler is a simple Windows property handler which provides an easy to use, in-process API for viewing and editing metadata embedded in taglib archives. Taglib Property Handler is well suited to Windows and Windows CE platform deployment where it should be available from the Windows system path. Taglib Property Handler is... Handles multiple formats Embed XML or plain text Encryptable Handles archive metadata types. Handles more than the taglib types; for example, it can handle taglib: @lang @property(w:rootTag) @lang @value(w:lang,ab.g:/resources/lang) @lang @value(w:lang,en.g:/resources/lang) @lang @value(w:lang,fr.g:/resources/lang) NOTE: If your application needs to use tags which are not provided by taglib, you can embed the tags in an XML file that the Taglib Property Handler can use, and save the XML file as a property on the file. The format of such embedded tags is, for example, @lang @value(w:lang,%lang%) @lang @value(w:lang,%language%) The Taglib Property Handler also supports plain text strings in property files. If such property files are not available, the default XML property files can be used. The same property files are used to handle multiple language types, not only for language types provided by Taglib, but also for third-party languages. Embedded XML Tags Embedded XML tags are enclosed in the start and end tags of the page. The embedded tags can use double quotes to surround any text, but do not use single quotes for the property names (e.g., value="JavaScript"), and don't need to use the TAB notation for property names (e.g., w:lang="en.g"). The embedded tags don't need to include a TAB character, but if they do, the TAB must appear within the quotes. The property types supported are those provided by Taglib (such as lang and language), as well as custom tags provided by the application. XML property file data can be saved directly, or saved as a property, similar to the way the Property Handler saves property data for files

What's New in the Taglib Property Handler?

Taglib Property Handler is a simple Windows property handler designed to back onto Taglib, allowing Windows Explorer, Windows Search and other applications using the same API to access metadata from a wide range of media formats. Taglib Property Handler allows you to add or remove metadata to a file, folder, DVD, Audio CD, VCD, image, video file. We support adding or removing metadata to the CDDA, CSS, DATA, META and IMD formats.
