KeyMacro is a useful utility that you can use to simulate the function of the standard keyboard keys on your Mac. The program works as the first layer of the keyboard driver, meaning that it manages to intercept all the keystrokes of the system and replaces the system-specific keys with the virtual ones. In turn, the "Input Method Editor" allows you to change the behavior of your Mac's keyboard. This means that the layout of the keys can be altered, and you can create your own keyboard shortcuts with the help of KeyMacro. The program also allows you to change the input language, which means you can modify the way characters are inputted to your Mac and the language to which the characters are inputted, and even modify their appearance.
