## What's New in the Attache?

Attache is simple in use, yet powerful in features and accessible to everyone. It is designed for small business, home-office or even personal needs. The Attache application could be used for data management. In this case, it is also possible to synchronize the data (backup) in case of hardware or software failure. The availability of Attache for Windows and Linux can be considered to be one of the basic features. The user interface is friendly and modern. Attache consists of a program component as well as a database. This means that Attache can save all the data locally. The database can be stored in a separate file (e.g. Excel or SQLite). But Attache always uses the file system (e.g. on an external hard drive or SD-card). The back-up of all files and the date and time will always be saved. Attache is a stand-alone database system. Attache does not depend on any database server. The data is stored in a file in the system's file system and the data is only available to Attache. Attache can support large volumes. A few gigabytes of data can be stored with Attache on a USB drive. It is also possible to save a few gigabytes on a physical hard drive. The required memory on the computer will depend on the amount of the data. A typical configuration is a USB drive with 64 GB for a few gigabytes of data. When the application is in use, the data is only accessible to the current user (e.g. Attache can be used by different users). The user is responsible for the data. The user cannot simply send the data to the cloud. Attache is a cross-platform application and therefore compatible with multiple operating systems (Windows, Linux, macOS). The application is compatible with JDK 1.8 and higher. Attache features File: The data is stored in a text file. Attache can use the file system (e.g. on an external hard drive or SD-card) Date and Time: Attache uses the current date and time to store the file. The date and time are saved into the header of the file. Password: Attache uses the most modern way to encrypt the file: The data is encrypted using a password. All passwords are stored in a file. The passwords are generated by the Attache application (e.g. on startup). Search: Attache offers a powerful search function. The search function can be used to find specific words in the file or to find files based on a specific date. The Attache search engine can also be used to find the file in the cloud. A search for "Guidelines" in Attache will result in the following file: Can Attache be used for large files
