Virtual Dimension is an application that allows you to switch virtual desktops, i.e. keep many open windows simultaneously on your Windows PC. It allows you to create as many virtual desktops as you wish and switch them quickly. Its user interface is a bit more complex than the ones of other similar applications, but the price to pay is a fully customizable setup that allows you to bring back your settings at any moment by just clicking a button. You can switch back to the main desktop just by a hotkey command, or even with a keyboard shortcut. You can also change the desktop background and the title color of any desktop without losing all the windows currently open. The program uses in-memory data so the installation is very quick and you don't need to reboot after it's been installed. All your windows are restored when you open Virtual Dimension and each desktop can be assigned a number. This allows you to make a lot of different desktops with your open windows in different locations. The program can also create a desktop for each application you have currently running, and this can be configured with a large number of options. The program allows you to create custom hotkey combinations to switch back to your active desktop, or to set the desktop you want to switch to automatically. You can also create custom keyboard shortcuts for every desktop and add a desktop context menu to quickly open every window of a certain desktop.
