Starch dispersion is used in a wide range of applications and is usually prepared by the action of mechanical forces and/or heat on the starch. This process involves the use of machinery, which can be costly and which is often difficult to use on an industrial scale. EP-A-0 674 072 discloses the preparation of a dispersion of starch and a second component, e.g. of a carbohydrate or sugar or derivative thereof, using cationic surfactants. Dispersions of this type are proposed for incorporation into a cosmetic formulation. According to EP-A-0 674 072, the degree of dispersion of the starch, i.e. the amount of the second component present in the starch, can be varied by

controlling the ratio of the carbohydrate to the starch. The ratio is preferably about 5:1. It is also disclosed that the stability of the dispersion can be improved by the addition of salts. WO 92/16711 discloses a method for producing a water-in-oil type emulsion using starch and/or a partial hydrolysate of starch in the presence of a certain amount of a polyoxyalkylene ether. It is an object of the present invention to provide a stable starch dispersion which is suitable for a wide range of applications and which can be prepared simply and on an industrial scale. Accordingly, the present invention provides a stable dispersion comprising (a) starch and (b) an oil phase wherein the amount of (b) in the dispersion is from 0.1 to 15 wt %, based on the total amount of the dispersion. An oil phase can be present in the dispersion and 77a5ca646e

The good thing is that Free Port Scanner runs on low computer resources, but on Windows 7 there are moments when the program is not responding at all, so you need to close it using Task Manager.
