Defining the range of lighting Most of the time, you want the lighting in your photo to be as even as possible. Light that is too bright becomes very distracting. Light that is too dark can appear as if the photo is trying to tell a story — and the

Q: UICollectionView dataSource update after adding cells I have a UICollectionView with a custom UICollectionViewLayout. My data is represented by 3 "cell views", but the view is really only 2 cells. I'm adding cells dynamically based on some conditions on my data (i.e. "if the data is new, add this one"). I'm doing it like this:

```
- (void)addCellsWithData:(NSArray *)data { if (self.dataSource) { [self.dataSource removeAllObjects]; } NSMutableArray *arr = [[NSMutableArray alloc] init]; for
```

```
(NSDictionary *dic in data) { View
*view = [self
buildViewWithData:(NSArray
*)dic[@"data"]]; [arr addObject:view]; }
self.dataSource = arr; if (self.delegate
&& [self.delegate respondsToSelector:@
selector(collectionView:cellViewForItem:
)]) { [self.delegate
collectionView:self.collectionView
cellViewForItem:nil]; } } this is working
fine. But the layout being used is just a
UICollectionViewFlowLayout, and not a
custom layout. How can I update the
collectionView's layout after adding new
cells? A: just have the newly added cell
```

be the last cell that's visible or just update your layout from the `collectionView(_:cellForItemAt:)` delegate method

Q: Serialization order in Java I am currently using `ObjectOutputStream` to serialize objects. Why I get :

```
[c2@foo.b:33]$ java -cp out.jar test.Main [c2@foo.b:36]$ obj.toString() "Hello" [c2@foo.b:37]$ obj2.toString() "World!"
```

And not :

```
[c2@foo
```

What's New In?

Q: `addSubview:` vs `addSubview:withConstraints:` and

`addConstraints:` Since all the various property accessors for `UIView` subviews can be either set or queried directly, the convention is to use `addSubview:` (or `addSubview:withConstraints:`) for properties that the view controls, or `addConstraints:` to set properties which will be constrained to be subordinate to the view. For example, suppose I have a `UIView` which I want to add a `UILabel` subview in the centre of the screen. I could do it either of these ways: `[theView addSubview:theLabel]` `[theView addSubview:theLabel withConstraints: NSArrayLayoutConstraint.constraintsWithVisual`

Format: @"H:|- [theLabel] -|",
@"V:|- [theLabel] -|",
@"H:[theView] - [theLabel]",
