Q: Add Long and String column in mysql using mysql workbench I want to add two columns in mysql(5.1.1) database using mysql workbench. I have added column through the window and i can see the column but i am unable to see the data that i inserted. As this is the first time that i am entering the database i am not sure if i have done something wrong or i am missing something. After adding the data and adding column i am facing the below problem, Any help would be appreciated

A: A column must be of the same size as all of its indexes. In this case, the column is an int column, but both the PK and the FK are both varchar(3) in size. You cannot add an int column and then use it as a FK to another row in the same table unless that int column gets a varchar(3)
