\* Photoshop Elements is the best beginners' program. Many photographers think that Photoshop is too complicated for their needs, but it's actually their entry-level package. If you're comfortable working in Photoshop, then it's the program you want to get. It's very good and offers many powerful features. However, the learning curve for a beginner is steep. Photoshop Elements is a smaller program that's more accessible, with less features and a simpler interface. \* Gimp is the other good free graphics program. Gimp does not use Photoshop's layer system, and it's usually considered a "non-Photoshop" package. It's powerful and user friendly, and it has a huge user base. However, it may be too much for a beginner. The two software programs are very good at what they do, and if you want to learn how to use each of them, they're both worthwhile. So give both a try and see which one is for you.

**Exposure: How to Stop Shooting in Light** The purpose of good exposure is to capture the full image of your subject, with the highlights, midtones, and shadows all just right. We consider a scene with excellent exposure to be one with the highest amount of detail and contrast, which is very pleasing to look at. A scene with low exposure (mixed of very dark, light, and middle tones) is one that has low contrast and low detail. The best way to ensure good exposure is to stop down the aperture of your lens as much as possible. If you want to see what exposure looks like in-camera, then start with an aperture of f/11 and look at the image on a monitor or on a slide.

**Mixed-Light Photography** The human eye is very sensitive to light, so a light-filled area will look good, whereas a dark area will look good. You can do this effect with your camera as well. For the most part, people in everyday life tend to walk around in a consistent setting, so they don't move much and don't tend to look up, down, or toward or away from the sun. The chart below provides a quick, broad guide for photographers to understand how mixed lighting works in real-life situations.

**Mixed Light Light Sources**

**AMB Light:** Ambient light from reflected or transmitted light. **Clouds:** Changes in the color and intensity of sunlight,

Q: InDesign: CSV file to DWG insertion I have a monthly report which is delivered to me in an InDesign CSV, the trouble is that all the data is formatted so that the columns are aligned and the rows start at page 1. I need to insert this data into an existing DWG file at the start of page 2. How can I do this? A: Go to File » Save As, enter the name you want the document to be, and in the Save As Type box, select Adobe InDesign CS6 Document. Click on the Format for dialog box and then go to the Items/Pages tab. Select the item you want to insert (like a section) and click on the Insert button. In the dialog box choose a location and change the frame size. Check the box next to Start on a new page if you want to start the item on a new page. Click OK, then Save, if you haven't started the file already. To make it easier, you can use File » Scripts » AutoInsertToPDFSave As to save you from going through the dialog boxes.
