So for $\rightarrow\infty$ the impurity is basically frozen in its original position. Applying a uniform magnetic field is a "Heisenberg treatment" for the quantum impurity. Therefore, in this case it is not necessary to add a corresponding renormalization. The present thermodynamics approach provides a rigorous way to describe the zero-temperature limit of the Hubbard model. We have shown that

the introduction of an off-diagonal term makes the impurity a superfluid. As argued above, the Goldstone boson dispersion relation implies superfluidity for zero temperature and uniform magnetic field. The question arises to what
