The FPS is the frequency at which the images are captured. A FPS (frames per second) of 20 is equivalent to 1 image per 1/20th of a second. It is determined by the hardware specifications and OS that it is running on. You should stick with a maximum of 60 FPS unless you have a good reason to go higher (depends on the application). Higher FPS lead to a more stuttering looking image and video. Some application will allow you to have a setting of > 60 FPS, but you should avoid it. Some games have been known to cause problems if they are fed with a signal at > 60 FPS. See this link for more information: We suggest the following: If you are using a high-end computer, the one that can handle 3D rendering at 60 FPS, then you can set the FPS to any number from 60 to the maximum you can have (generally 4096). If you are using a low-end computer, the one that cannot handle 3D rendering at 60 FPS, then you can set the FPS to 20. If you are using a computer that can handle 3D rendering at 60 FPS, but you don't care about how fast the images appear, then you can set the FPS to 60, but the images will appear smoother than with 20 FPS. The amount of memory the camera takes up is calculated according to the resolution and color depth. The Following table shows how much memory the webcam takes. Camera resolution (pixels/inch) Color Depth Memory (MB) 640 x 480 8 or 16-bit 2 640 x 480 16-bit 6 640 x 480 24-bit 18 VGA 8-bit 2 VGA 16-bit
